MODULE *LNContracsUsingBitcoinTransactions*

This spec captures the behaviour of commitment transactions on the two sides of a Lightning channel.

We model the various kinds of outputs a commitment transactions will have over its lifetime.

The state of the commitment transaction changes in reponse to the various actions like supersede, publish, etc are taken by parties.

We also do not deal with the communication protocol between nodes for creating and updating commitment transactions. This spec will only focus on the various commitment transaction and their lifecycle in response to interaction between parties and the blockchain.

We ignore the details of how transactions are signed and just mark transactions as signed. This lets us focus on the specifying the behaviour of the commitment transactions without dealing with lower level complexities.

The model defines the intial balance from alice to bob. TLA+ will handle situations where channels are balanced and when all the balance is on the other side.

TODO: Add actions for closing channels. Currenly we only have support for breach *tx* and the corresponding breach remedy txs.

TODO: Add *HTLCs*.

EXTENDS *Integers*,
TLC,
Sequences,
FiniteSets,
BitcoinTransactions

CONSTANTS

INITIAL_BALANCE,	Initial balances for alice and bob
CHANNEL_PARTY	Channel between parties

VARIABLES

funding_txs,	The *TXID* for the channel funding txs
commitment_txs,	Commitment txs held by each party. Not yet broadcast.
breach_remedy_txs	*BR* txs held by each party. Not yet broadcast.

$SeqToSet(s) \triangleq \{s[i] : i \in \text{DOMAIN } s\}$

$vars \triangleq \langle chain\_height, transactions, mempool, published, commitment\_txs, breach\_remedy\_txs, funding\_txs \rangle$

$Init \triangleq$
$\land transactions = [id \in TXID \mapsto [inputs \mapsto \langle\rangle, outputs \mapsto \langle\rangle]]$
$\land funding\_txs = [channel \in CHANNEL\_PARTY \mapsto NoTxid]$
$\land commitment\_txs = [channel \in CHANNEL\_PARTY \mapsto [p \in channel \mapsto NoTxid]]$

$\land$ $breach\_remedy\_txs = [channel \in CHANNEL\_PARTY \mapsto [p \in channel \mapsto NoTxid]]$
$\land$ $chain\_height = 0$
$\land$ $mempool = \{\}$
$\land$ $published = [id \in TXID \mapsto NoSpendHeight]$

$TypeOK \triangleq$
$\land$ $transactions \in [TXID \to [inputs : Seq(Input),\ outputs : Seq(Output)]]$
$\land$ $funding\_txs \in [CHANNEL\_PARTY \to TXID \cup \{NoTxid\}]$
$\land$ $commitment\_txs \in [CHANNEL\_PARTY \to [PARTY \to TXID \cup \{NoTxid\}]]$
$\land$ $breach\_remedy\_txs \in [CHANNEL\_PARTY \to [PARTY \to TXID \cup \{NoTxid\}]]$
$\land$ $mempool \in$ SUBSET $TXID$
$\land$ $published \in [TXID \to Int]$

Choose keys for parties that have a channel.

The keys should have the same sequence number. This becomes important when parties create commitment transactions.

$ChooseChannelKeys \triangleq$
CHOOSE $\langle j, k\rangle \in Keys \times Keys$:
$\land$ $\{j[1], k[1]\} \in CHANNEL\_PARTY$ Choose parties that have a channel
$\land$ $j[2] = k[2]$ Choose keys with same index

$ChannelKeys(channel) \triangleq SetToSeq(\{\langle p, 1\rangle : p \in channel\})$

$ChoosePartyKey(party) \triangleq$
CHOOSE $k \in Keys : k[1] = party$

$AllCommitmentsTxids \triangleq$
$\{commitment\_txs[cp[1]][cp[2]] :$
$cp \in \{\langle channel\_party, party\rangle \in CHANNEL\_PARTY \times PARTY : party \in channel\_party\}\}$

$AllBreachRemedyTxids \triangleq$
$\{breach\_remedy\_txs[cp[1]][cp[2]] :$
$cp \in \{\langle channel\_party, party\rangle \in CHANNEL\_PARTY \times PARTY : party \in channel\_party\}\}$

TXID id has not been used yet.

TODO: We might need to rethink how we track txids, but for now, this is the solution.

$IsUnused(id) \triangleq$
$\land$ $id \notin mempool$
$\land$ $published[id] = NoSpendHeight$
$\land$ $id \notin AllCommitmentsTxids$
$\land$ $id \notin AllBreachRemedyTxids$

Confirm a transaction in *mempool*. This publishes the transaction.

We need to add a function like $IsOutputSpent(o)$ which checks if there is any transaction in published with o as input.

$ConfirmTx(id) \triangleq$
$\quad \land\ ConfirmMempoolTx(id)$
$\quad \land$ UNCHANGED $\langle commitment\_txs,\ breach\_remedy\_txs,\ funding\_txs \rangle$

We generate simple $p2wkh$ transactions as inputs for funding transactions

Outputs both have $INITIAL\_BALANCE * 2$ so that later we can have bi-directional channel with $INITIAL\_BALANCE$

$CreateInputsForFundingTx(id,\ channel) \triangleq$
$\quad \land\ funding\_txs[channel] = NoTxid$ No funding tx for channel exists
$\quad \land \exists\, party \in channel :$
$\quad\quad \land\ AddP2WKHCoinbaseToMempool(id, \langle ChoosePartyKey(party) \rangle, INITIAL\_BALANCE * 2)$
$\quad \land$ UNCHANGED $\langle commitment\_txs,\ breach\_remedy\_txs,\ funding\_txs \rangle$

Create funding transaction. The funding tx is not locked at this point.

Once a commitment tx is signed then we can send this funding tx to the *mempool*.

Create a funding tx only if no funding tx exists for the channel

$CreateFundingTxByParty(id,\ channel) \triangleq$
$\quad \exists\, o \in UnspentOutputs,\ p \in channel :$
$\quad\quad$ transaction with id not created yet
$\quad\quad \land\ IsUnused(id)$
$\quad\quad \land\ funding\_txs[channel] = NoTxid$ No funding tx exists for the channel
$\quad\quad \land\ OutputOwnedByParty(o,\ p)$
$\quad\quad \land$ LET $fundingTx \triangleq CreateUnsignedMultisigTx(o,\ ChannelKeys(channel),\ INITIAL\_BALANCE)$
$\quad\quad\quad$ IN
$\quad\quad\quad\quad \land\ transactions' = [transactions$ EXCEPT $![id] = fundingTx]$
$\quad\quad\quad\quad \land\ funding\_txs' = [funding\_txs$ EXCEPT $![channel] = id]$
$\quad\quad \land$ UNCHANGED $\langle commitment\_txs,\ breach\_remedy\_txs,$
$\quad\quad\quad\quad\quad\quad chain\_height,\ published,\ mempool \rangle$

****
Create a commitment tx for for a channel parties.
****

$CreateCommitmentTx(txid,\ channel,\ party) \triangleq$
$\quad$ $txid$ is not used
$\quad \land\ IsUnused(txid)$
$\quad$ Funding tx for channel exists
$\quad \land\ funding\_txs[channel] \neq NoTxid$
$\quad$ Commitment tx for channel and party doesn't exist
$\quad \land\ commitment\_txs[channel][party] = NoTxid$
$\quad$ Create the commitment tx for party paying back to funder

$\land$ LET $ftx\_id \triangleq funding\_txs[channel]$
$ftx \triangleq transactions[ftx\_id]$
$ftx\_input \triangleq transactions[ftx.inputs[1].txid]$
Create commitment tx, that spends ftx and creates outputs for party and other party
Use amounts based on $party =$ funding input key holder
$tx \triangleq CreateP2WKHTx(\langle ftx\_id, ftx.outputs[1].index\rangle,$
$ftx\_input.outputs[1].keys,$
$ftx\_input.outputs[1].amount)$
